ABSTRACTED-PUB-NO: JP11169181A

BASIC-ABSTRACT:

NOVELTY - A method for identification of yeast-like fungi with a gene engineering procedure is new, and comprises: (1) preparing a template genome DNA extracted from microorganism to be identified; (2) combining oligonucleotides sequences 1 and 2, or 3 and 4 (all fully defined in the specification) to give a pair of primers; (3) PCR with the primers to amplify intermediate region DNA of a gene encoding for 18S-ribosome RNA; (4) determining the base sequence of the amplified product with conventional methods; (5) comparing the determined base sequence with that of known DNA sequence to find most homologous fungi as the aimed yeast-like fungi, especially those of *Bensingtonia*, *Bullera*, *Candida*, *Cryptococcus*, *Debaryomyces*, *Dekkera*, *Kluyveromyces*, *Metschnikowia*, *Rhodotorula*, *Sporobolomyces*, *Torulaspora*, *Tremella*, *Trichosporon*, *Udeniomyces*, *Zygosaccharomyces*, *Leucosporidium*, *Filobasidium*, *Filobasidiella*, *Endomyces*, *Saccharomyces*, *Systofilobasidium*, *Brettanomyces*, or *Dipodascus* spp.

USE - The determination is useful for investigation of the trend between human diseases and fungi, degeneration of foods, and route of communicable diseases.

ADVANTAGE - Rapid and accurate identification of a specific yeast-like fungus using a specific base sequence in the intermediate region of a gene encoding for 18S-ribosome RNA (18S-rRNA).
